

bSmart is an AI harness.

A lightweight operating layer that gives AI agents context, continuity, and a safer way to get work done.

It works around the model—not instead of it.

● CONTINUITY

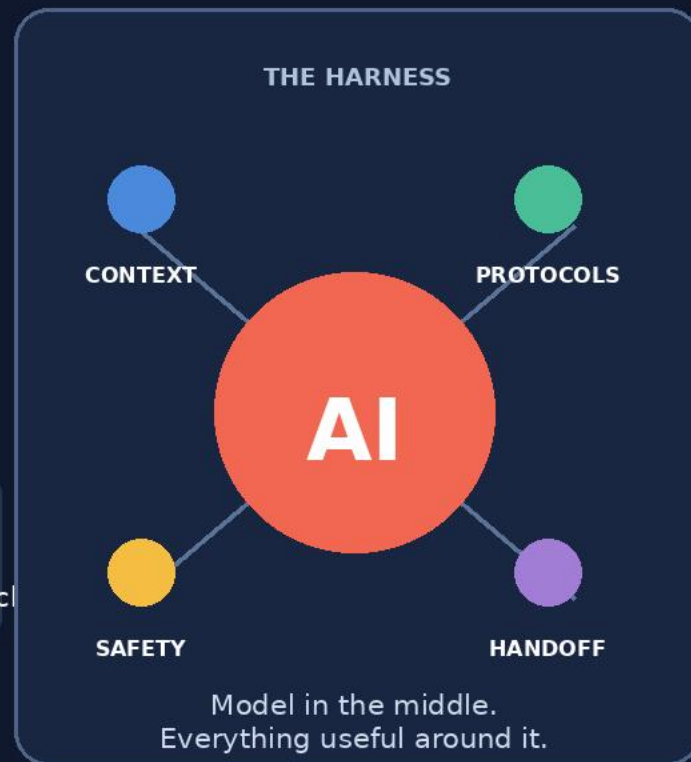

Projects and memory carry work forward.

● DISCIPLINE

Protocols turn good intent into repeatable work.

● CONTROL

Visible, approval-aware actions keep humans in control.

A practical set of features for work that lasts.

Organized around how people actually work with an AI.

WORK

Move work forward

● Projects

Keep context and focus attached to the right project.

● Tasks

Track next actions, handoffs, and safe resume points.

● Workdocs

Keep detailed notes for larger or multi-session work.

KNOWLEDGE

Make good work reusable

● Library

Store references, templates, and durable knowledge.

● Decision Log

Keep important choices and approvals traceable.

● History

Remember completed work without bloating the T

SYSTEM

Keep the operating layer healthy

● Safety

Read first, show intent, prefer reversible changes.

● Setup

Bootstrap the structure and discover protocols.

● Extensions

Add optional capabilities when they earn their place.

The point is not more features. It is a clearer way to use the ones that matter.

The pieces form a simple loop—not a pile of tools.

Start with context. End with something the next session can use.
